.0. A: I have solved this problem. I have installed the "Adobe Reader 10" dll in my applications instead of the photoshop 15.0.0 and it is not working. Also, I have restarted the system and dll of photoshop was loaded in the applications. Q: Does caesium have a half life of "decay"? I understand that there is a decay half life for caesium, but I was wondering if the decay was complete (and a caesium atom would become a potassium atom, for example). (NB: for simplicity, I will henceforth refer to the isotope of caesium-137 as  $^{137}\text{Cs}$ ) The main decomposition product of  $^{137}\text{Cs}$  is  $^{137}\text{Ba}$ . We have  $^{137}\text{Cs} \rightarrow ^{137}\text{Ba} + \alpha$ . In the reactor-grade form of caesium ( $^{137}\text{Cs}$ ) there is an estimated half-life of 30 years, and an energy of 2.2 MeV. The alpha particle kinetic energy is approximately 0.5 MeV. The  $\alpha$ -particle energy is high enough to break the carbon atom apart in a collision. The collision fragments the original

---

nucleus into smaller fragments, and to produce the  $\alpha$ -particle it is necessary to start with a carbon nucleus. Now, if you have a Cs-137 atom, there is an energy state within it called the  $2s^2 1S_0$  ground state, and an excited  $6p^3 P^o_0$  state, and if the energy of the decay is greater than the excitation energy, then you can't reverse the process. Since the  $\alpha$ -particle in the decay comes from a reaction that requires the original atom to have had the required energy, then the nucleus must be in its ground state, and so if the original atom was in its ground state it must remain there. Granulocyte function and pathogen phagocytosis in elderly healthy donors. Phenotypic changes occurring in the leukocyte compartment in old age are poorly understood. We studied the effect of age on various functions of neutrophils, monocytes, and lymphocytes. Phagocytosis and killing 82157476af
